

## Simply typed $\lambda$ calculus

if true then 0 else false

X type systems are conservative

$$T := \text{Bool} \mid T \rightarrow T$$

E.g.  $\text{Bool} \rightarrow \text{Bool}$

$\text{Bool} \rightarrow (\text{Bool} \rightarrow \text{Bool})$

---

$\text{int} \not\models (\text{int } x)$

Inhibition

arguments have types

---

Typed  $\lambda$  calc

$t = x$

$\mid \lambda x:T. t$

$\mid t \ t$

a value is either  
a Boolean or  $(\lambda x \dots)$

$(\lambda x:T. t) \ v \rightarrow$   
 $[x \mapsto v]t$

---

$t_1 \rightarrow t'_1$

---

$t_1 \ t_2 \rightarrow t'_1 \ t_2$

---

$$\frac{t \in \text{Nat}}{\text{isZero } t \in \text{Bool}} T_{\text{isZero}} \quad \left( \text{Recall} \right) \quad \frac{t_2 \longrightarrow t'_2}{v \ t_2 \longrightarrow v \ t'_2}$$

---

typing context

$$\frac{\boxed{x \in T_1} \vdash t \in T_2}{\lambda x : T_1. t \in T_1 \rightarrow T_2} T_{\text{ABS}}$$

if  $x$  has type  $T_1$  then I can prove  $t \in T_2$

---

Induction

$$x \in \text{Int} \vdash x + x \in \text{Int}$$

a typing context  $\Gamma$  is a sequence of  
the form  $\alpha_1 \in T_1, \dots, \alpha_n \in T_n$

$\Gamma$  can be  $\emptyset$  (empty)

$$\underbrace{\Gamma, \alpha_1 \in T_1}$$

---

$T_{ABS}$

$\alpha$  is  
no longer  
free

$$\frac{\Gamma, \alpha \in T_1 \vdash t \in T_2}{\Gamma \vdash \lambda x:T_1. t \in T_1 \rightarrow T_2}$$

$T_{APP}$

$$\frac{\Gamma \vdash t_1 \in T_1 \rightarrow T \quad \Gamma \vdash t_2 \in T_1}{\Gamma \vdash t_1 \ t_2 : T}$$

$T_{\text{var}}$

$$\frac{x:T \in \Gamma}{\Gamma \vdash x \in T} \quad \begin{array}{l} \text{the typing} \\ \text{context is} \\ \text{a set} \end{array}$$

$T_{\text{if}}$

$$\frac{\Gamma \vdash t_1 \in \text{Bool} \quad \Gamma \vdash t_2 \in T \quad \Gamma \vdash t_3 \in T}{\Gamma \vdash \text{if } t_1 \text{ then } t_2 \text{ else } t_3 \in T}$$

$$\begin{array}{l} \text{if true then } (\lambda x:\text{Bool}. x) \text{ else } (\lambda x:\text{Bool}. \text{not } x) \\ \in (\text{Bool} \rightarrow \text{Bool}) \end{array}$$

$$x \in \text{Bool} \equiv x : \text{Bool}$$

✓ typing context

$$\frac{x : \text{Bool} \in \{x \in \text{Bool}\}}{T_{\text{VAR}}}$$

$$\frac{x : \text{Bool} \vdash x \in \text{Bool}}{T_{\text{ABS}}}$$

$$\frac{\checkmark}{\emptyset \vdash \text{true} \in \text{Bool}}$$

$$\frac{\emptyset \vdash \lambda x : \text{Bool}. x \in \text{Bool} \rightarrow \text{Bool} \quad \emptyset \vdash \text{true} \in \text{Bool}}{\emptyset \vdash (\lambda x : \text{Bool}. x) \text{ true} \in \text{Bool}} T_{\text{APP}}$$

Inversion lemma (Just reading rules upwards)

If  $\Gamma \vdash x:T$  then  $x:T \in \Gamma$

If  $\Gamma \vdash \lambda x:T. t \in R$  then

$R = T \rightarrow R_2$  for

some  $R_2$

and  $\Gamma, x:T \vdash t \in R_2$

$\vdots$

---

Uniqueness theorem

In a given typing context  $\Gamma$ , a term  $t$ ,  
with free variables in  $\Gamma$ , has at most  
one type

$\frac{}{\Gamma \vdash x \in \text{Bool}} \quad \Gamma \vdash x \in \text{Bool}$

$\frac{}{\Gamma \vdash x \in \text{Bool} \rightarrow \text{Bool}} \quad \Gamma \vdash x \in \text{Bool} \rightarrow \text{Bool}$

## Canonical forms lemma

① if  $v$  has type  $\text{Bool}$ , then  $v$  is either `true`/`false`

② if  $v$  has type  $T_1 \rightarrow T_2$  then

$$v = \lambda x:T_1. t$$

---

## PROGRESS THM

Suppose  $\emptyset \vdash t \in T$

Then  $t$  is a value or  $t \rightarrow t'$

PROOF Induction on typing derivation

the only interesting case  $T_{\text{App}}$

imagine  $t$  is of form  $t_1 t_2$

By hypothesis  $t_1$  is a value or  $t_1 \rightarrow t'_1$

case  $\rightarrow$  - if  $t_1 \rightarrow t'_1$  then  $t \rightarrow t'_1 t_2$

case  $\text{V}$  - if  $t_1$  is a value

case B1

$t_2$  can take a step  
 $t \rightarrow t_1 t_2'$

case B2

$t_1$  and  $t_2$  are values

By canonical forms  
 $t_1 = (\lambda x. t_1')$

this means

$$t \longrightarrow t_1'$$

$$[x \mapsto t_2] t_1'$$

## PRESERVATION

If  $\Gamma \vdash t \in T$  and

$$t \longrightarrow t'$$

then

$$\Gamma \vdash t' \in T$$

## Erase theorem

$$\text{erase}(x) = x$$

$$\text{erase}(\lambda x:T. t) = \lambda x. t$$

$$\text{erase}(t_1 \ t_2) = \text{erase}(t_1) \ \text{erase}(t_2)$$

Then

- If  $t \rightarrow t'$  under typed evaluation  
then  $\text{erase}(t) \rightarrow \text{erase}(t')$

- If  $\text{erase}(t) \rightarrow m'$  then  
there is a typed term  $t'$  s.t.  
 $t \rightarrow t'$  and  $\text{erase}(t') = m'$
